## PROFILE

Persistent AI and Data Science professional applying solutions to CyberSecurity data challenges, solving complex problems and contributing to impactful real-world projects.

## EXPERIENCE

|                                                                                                                                                                                                                                                        |                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| <b>AI and CyberSecurity Intern - SQ1 Security Private Limited</b>                                                                                                                                                                                      | <b>June 2025 – Nov 2025</b> |
| <b>Vulnerability Detection Product</b>                                                                                                                                                                                                                 |                             |
| <ul style="list-style-type: none"><li>- RAG-based pipeline to analyze software vulnerabilities and generate contextual security insights.</li><li>- Embedding-based semantic retrieval to understand CVE patterns and automatically patches.</li></ul> |                             |
| <b>Policy Management Tool</b>                                                                                                                                                                                                                          |                             |
| <ul style="list-style-type: none"><li>- System to analyze informations and classify organizational policies and compliance types.</li><li>- Semantic embeddings to automatically categorize and maintain structured policy repositories.</li></ul>     |                             |
| <b>OCR-to-LLM Pipeline</b>                                                                                                                                                                                                                             |                             |
| <ul style="list-style-type: none"><li>- Fine-tuned a Biomedical NER model to extract diagnosis entities from clinical documents.</li><li>- Built a RAG pipeline to map extracted entities to ICD diagnosis codes.</li></ul>                            |                             |
| <b>MCP Server Integration</b>                                                                                                                                                                                                                          |                             |
| <ul style="list-style-type: none"><li>- Built MCP server integrations to orchestrate multiple AI tools through a unified LLM interface.</li></ul>                                                                                                      |                             |

## PROJECTS

|                                                                                                                                                                                                                                                                                                                     |                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <b>• EDGE EXTENSION - MODEL DEVIATION SUMMARIZER (2026)</b>                                                                                                                                                                                                                                                         | <a href="#">Repo Link</a> |
| <ul style="list-style-type: none"><li>- Developed a system to detect output drift and deviation in LLM conversations.</li><li>- Designed vector alignment techniques for prompt evaluation and correction.</li><li>- Generated optimized expert prompts to enhance consistency and reduce hallucinations.</li></ul> |                           |
| <b>• AI-DRIVEN-ZERODAY-SOC-MONITORING-TOOL (2025)</b>                                                                                                                                                                                                                                                               | <a href="#">Repo Link</a> |
| <ul style="list-style-type: none"><li>- Built AI-powered analytic agents for log and event analysis in SOC environments.</li><li>- Integrated semantic inference to generate threat insights and security alerts.</li><li>- Applied context-aware models to detect zero-day and emerging threats.</li></ul>         |                           |
| <b>• AI-PERSONALIZED-MAIL-COMPOSER (2025)</b>                                                                                                                                                                                                                                                                       | <a href="#">Repo Link</a> |
| <ul style="list-style-type: none"><li>- Created a pipeline to learn email style for personalized generation.</li><li>- Used semantic adaptation for context and tone per user preferences.</li><li>- Built a Streamlit UI supporting draft previews and guided composition.</li></ul>                               |                           |
| <b>• PROMPTMASKER (2025)</b>                                                                                                                                                                                                                                                                                        | <a href="#">PyPI Link</a> |
| <ul style="list-style-type: none"><li>- Python package to detect and mask sensitive data before sending prompts to LLMs.</li><li>- Uses heuristic-based redaction for privacy protection (not encryption-focused).</li></ul>                                                                                        |                           |

## EDUCATION

|                                                                        |                                       |
|------------------------------------------------------------------------|---------------------------------------|
| <b>M.Sc. Artificial Intelligence and Machine Learning (Integrated)</b> | <b>2022 – Present</b>                 |
| Coimbatore Institute of Technology, Coimbatore                         | <b>CGPA: 8.63 (Till 7th Semester)</b> |
| <b>Higher Secondary Education (HSC)</b>                                | <b>2021 – 2022</b>                    |
| Mahendra Matric Hr Sec School, Namakkal                                | <b>Percentage: 89.4</b>               |

## ACHIEVEMENTS

- **2024** - First Prize at **TechStars Startup Weekend Sustainability**.
- **2024** - First Place, **Impairathon** hackathon (360+ teams) by **StartupTN**.
- **2025** - Finalist, **Shaastra Programming Contest 2025** (IIT Madras).

## TECHNICAL SKILLS

**AI Technologies:** Model Finetuning, NLP, RAG, MCP, Agentic-AI, A2A Protocol.  
**Big Data & Analytics Tools:** Debezium, Kafka, ZooKeeper, PowerBI.  
**Cloud, Containerization & Version Control:** Docker, AWS, Git.  
**Programming Languages:** Python.  
**Database:** Firebase, MySQL, PostgreSQL.  
**Soft Skills:** Adaptability, Team Collaboration, Communication.
